### Module 9

# "Data Binding [Deeper Dive]"

# Agenda

- Data Binding Properties in Details
- Data Conversion
- Validation
- Data Binding Collections in Details

## The **Binding** Class

- Binding
  - ElementName, Source, RelativeSource
  - Path
  - XPath XML sources
  - Mode
  - Delay
  - NotifyOnSourceUpdated SourceUpdated event

  - FallbackValue + TargetNullValue
- Binding can be set
  - Declaratively in XAML
    - Full syntax or markup extension syntax "{}"
  - Programmatically in code
- Bindings can be cleared (in code) via BindingOperations.ClearBinding()

# Binding Mode

- The binding mode specifies the direction of the binding
- Binding
  - Mode
    - Default determined by the target property
    - OneTime
    - OneWay
    - OneWayToSource
    - TwoWay
  - UpdateSourceTrigger
    - Default determined by the target property
    - Explicit when BindingExpression.UpdateSource()
      is called
    - LostFocus
    - PropertyChanged

# Small, Important Features... ©

- Bindings can be delayed
  - New feature in .NET 4.5

- Applies for updates from target to source in two-way bindings
  - The delay does not apply for both directions!
- Data binding can be set up "visually" through Visual Studio

# Agenda

- Data Binding Properties in Details
- Data Conversion
- Validation
- Data Binding Collections in Details

### **IValueConverter**

- Value converters
  - Convert, format, localize, combine data
    - Conditionally or unconditionally
  - Usually applied with Data Binding
- ▶ IValueConverter
  - Convert()
  - ConvertBack()

Source -> Target Target -> Source

- Localization proceeds through the culture parameter
  - Defaults to xml:lang
- ▶ ValueConversionAttribute
  - Only conveys the intended meaning to tools
  - Has no semantic meaning!

#### **IMultiValueConverter**

- Multi-value converters
  - Performs similar conversion, but combines multiple values
- ▶ IMultiValueConverter
  - Convert()
    - Accepts object[] instead of just object
  - ConvertBack()
    - Returns object[] instead of just object
- Must use MultiBinding to apply multi-value converter!
- Side note:
  - There is also a PriorityBinding for use with asynchronous data binding. We will investigate that in Module 13

# Data Binding Special Cases

- Converters can return special values when conversions are not possible (or not wanted)
- ▶ Binding.
  - FallbackValue
  - DoNothing

Ignore update

- DependencyProperty.
  - UnsetValue

"Errorneous" update

# Agenda

- Data Binding Properties in Details
- Data Conversion
- Validation
- Data Binding Collections in Details

### Validation Rules

- Data bindings are subjected to a set of validation rules
  - Exceptions are by default not thrown
- ▶ ValidationRule
  - ExceptionValidationRule

built-in

- Setting Binding.ValidatesOnExceptions to true
  - is equivalent to adding ExceptionValidationRule
- Custom validation rules
  - Override ValidationRule.Validate()
  - ValidationResult signals success or failure

## Handling Validation Errors

- Validation.
  - HasErrors
  - Errors

ValidationError collection

Error

event

- Raised if Binding.NotifyOnValidationError == true
- ValidationErrorEventArgs
  - Action
    - Added
    - Removed
  - Error
    - ErrorContent
    - Exception
    - RuleInError
    - BindingInError

## Validation Error Templates

- Controls can set attachedValidation.ErrorTemplate property
- Note:
  - This is a ControlTemplate (not a DataTemplate)
  - AdornedElementPlaceholder refers back to control being validated!

### **IDataErrorInfo**

IDataErrorInfo in System.ComponentModel

```
public interface IDataErrorInfo
{
   string Error { get; }
   string this[ string columnName ] { get; }
}
```

- DataErrorValidationRule
  - Checks for errors raised by classes implementing IDataErrorInfo
- Setting Binding.ValidatesOnDataErrors to true
  - is equivalent to adding **DataErrorValidationRule**
- ▶ WPF 4.5 adds INotifyDataErrorInfo for more advanced uses
  - There is a similar Binding.ValidatesOnNotifyDataErrors

# Agenda

- Data Binding Properties in Details
- Data Conversion
- Validation
- Data Binding Collections in Details

## Design-time Data

 XAML allows setting specific properties applying only to design-time

```
<Window ...
   xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
   xmlns:mc="http://schemas.openxmlformats.org/markup-
compatibility/2006"
   mc:Ignorable="d">
   <d:Window.DataContext>
      <clr:Participants>
         <clr:Participant FirstName="Jesper"</pre>
                           LastName="Gulmann Henriksen"
                          Company="Wincubate ApS" />
        </clr:Participants>
    </d:Window.DataContext>
```

# Hierarchical Data Templates

#### ▶ HierarchicalDataTemplate

- Excellent for hierarchical data
  - e.g. file system etc.

#### Use

- HierarchicalDataTemplate for internal nodes
- "regular" DataTemplate for leaf nodes

#### Note:

A "non-recursive" example is supplied in Lab 3.3

# Sorting

- Bound data can be sorted through ICollectionView
- ICollectionView
  - SortDescriptions
    - SortDescription collection
- Specifically for ListCollectionView
  - CustomSort
    - IComparer implementation
- Note
  - The SortDescription class is defined in the System.ComponentModel namespace in WindowsBase.dll.

# Grouping

- ▶ Bound data can be grouped through ICollectionView
- ▶ ICollectionView
  - GroupDescriptions
    - PropertyGroupDescription collection
- ItemsControl
  - GroupStyle
    - HeaderTemplate, HeaderTemplateSelector
    - ContainerStyle, ContainerStyleSelector
    - Panel
- Custom Grouping
  - Can be performed by implementing IValueConverter appropriately

# Filtering

- Bound data can be filtered though ICollectionView
- ▶ ICollectionView
  - Filter
    - should be set to filtering predicate (of object!) in code
- ▶ This approach does not work for ADO.NET objects
  - These views are BindingListCollectionView
    - CustomFilter = "ColumnName Operator Value"

#### CollectionViewSource

- Collection views can similarly be created in XAML
  - Define a CollectionViewSource instance bound to data
  - Bind ItemsControl to the CollectionViewSource instance

```
<ListBox ItemsSource="{Binding Source={StaticResource cvs}}"
DisplayMemberPath="FullName"/>
```

Sorting can also be applied in XAML

## Summary

- Data Binding Properties in Details
- Data Conversion
- Validation
- Data Binding Collections in Details
